

Contract Portfolio Intelligence & Renewal Management

KPI Design | Renewal Governance | Revenue Analytics | Power BI | Agiloft | Portfolio Optimization

Overview

Knowing that a contract was approaching renewal was only part of the decision. The larger question was whether the contract was performing well enough to justify the time, resources and commercial effort required to renew and support it.

I helped build a contract portfolio intelligence process that connected renewal timing, original Sales estimates and actual contract sales so Program Managers and leaders could see portfolio health, focus limited resources and use renewal events to address risk, pricing, revenue and margin opportunities.

Business challenge

- Sales entered an estimated contract value during the bid/RFP process, while actual sales were captured through the sales engine when orders were coded to the contract.
- Contract and renewal information was tracked in Agiloft, but the underlying systems did not yet communicate cleanly enough to support reliable portfolio reporting.
- Leadership needed a practical way to see 30/60/90-day renewal demand, compare expected value with actual performance, and understand portfolio health across State, Local, Commercial and Federal contracts.
- The team could not wait for a perfect future-state integration, so the operating process and quality controls had to work while APIs and automation were still being developed.

Operating model

1. Capture Sales estimate + contract and renewal data	2. Validate QC controls bridge technology gaps	3. Analyze Power BI portfolio KPIs	4. Act PM renewal review and documented actions	5. Learn Feed actual performance into future pursuit decisions

KPIs and decisions

KPI / View	Decision supported
30 / 60 / 90-day renewal pipeline	What requires action now and what is approaching.
Renewed vs. pending	Whether renewal activity is progressing and where follow-up is needed.
Initial estimate vs. actual sales	Whether original opportunity assumptions translated into real contract performance.
State / Local / Commercial / Federal	Where portfolio value, performance, renewal exposure and opportunity are concentrated by market.
Portfolio by Program Manager	Where workload, risk and opportunity are concentrated by owner.
Top vs. bottom contracts	Where limited resources should be focused.
Renewal risk + pricing / margin opportunity	Whether renewal should be used to remediate risk or improve contract economics.

From dashboard to management process

The dashboard was not intended to be passive reporting. Program Managers reviewed their portfolios, documented actions against outstanding renewals, identified risks to renew, and surfaced opportunities to improve pricing, revenue and margin.

- Review contracts approaching renewal and confirm ownership and next actions.
- Evaluate renewal viability using actual contract performance rather than contract value alone.
- Identify contracts where pricing could be adjusted during renewal.
- Surface revenue or margin opportunities and risks requiring cross-functional attention.
- Compare portfolio health across State, Local, Commercial and Federal contract segments.
- Prioritize the portfolio by value, performance, risk and opportunity rather than treating every contract equally.
- Use the gap between original opportunity estimates and actual sales as evidence when evaluating future RFPs and pursuit assumptions.

Closed-loop portfolio intelligence

RFP / Sales Estimate → Contract Award → Actual Sales → Portfolio KPI → 30/60/90 Renewal Review → Risk & Opportunity Action → Renewal / Pricing Decision → Actual Performance → Better Future RFP Intelligence

This created a feedback loop between pre-award assumptions and post-award performance. It gave the organization a more fact-based way to evaluate portfolio health and helped inform where future pursuit and contract-management effort should be spent.

Technology and controls

Agiloft supported contract and renewal tracking. **Power BI** provided portfolio-level dashboarding. Actual sales were captured through the sales engine when orders were coded to the contract. Because the systems did not yet fully communicate, we developed interim reporting and QC controls while APIs were being built to automate the data flow.

The key transformation was not the dashboard alone. It was establishing the definitions, controls, review cadence and accountability required to make the information useful before the technology environment was fully integrated.

Representative portfolio artifact

The accompanying workbook uses simulated contract names, owners and financial values to demonstrate the dashboard and operating model. It does not contain employer or customer data.

Portfolio disclosure

Representative professional case study reconstructed from work performed. Company, customer, employee and contract-identifying information has been removed or generalized. Financial values in the supporting workbook are simulated. This is not an original employer document.
